

# Rust Introduction

Frank Rehberger  
(2025)

# Agenda

- Start: 9:00
- Pause: ca 10:30 (15:min)
- Lunch: ca 12:15 (60 min)
- Pause: ca 15:00 (15 min)
- End: ca 17:00

# Introduction to Rust

## Day 1

Tooling, Workspace,  
Datatypes, Derive, Macros,  
File-IO

## Day 2

Multithreading, Messaging,  
Async Programming, Web-  
Service, Tests

## Day 3

Serialization, Libraries,  
Dependencies, FFI

Requirement: Attendees use their personal device with IDE and are able to install Rust from web, see: <https://www.rust-lang.org/tools/install>

# Demo Project

Github

<https://github.com/frehberg/rust-demo-project.git>

# Terminology

# Terminology

## Framework

### Rust

Language Syntax and Compiler rustc.

### rustup-tool

Rust update tool installing rustc, cargo, clippy, etc.

### Package

Versioned deliverable of crates at <https://crates.io/> or github.

### Cargo

Build tool reading Cargo.toml, downloading crates and compiling source.

# Terminology

## Cargo Features

### **Build-Script**

Project file `./build.rs` performing pre-processing.

### **Cargo Plugins**

Extensions of Cargo, eg. Clippy or Workspaces.

# Overview

- 2015 - Release of version 1.0, current ver 1.84
- System programming.
- Memory-safety.
- No runtime, just rust on top of bare-metal.
- Feature Editions 2018, 2024, etc.
- Bundled with Cargo Build Tool + version + X-comp.
- Releasing stable and bi-weekly unstable version.

```
$ rustup toolchain list; rustup update
```

- Tool managing installation of target X-compilers

```
$ rustup target list
```

# Basic Syntax

Syntax is similar to other curly-brace languages, like  
C++ or Scala

Data is organized into structs, enums (algebraic data  
types), tuples, and primitives

# Safety

In safe<sup>\*</sup> Rust, it is impossible to get segfaults, memory corruption, dangling pointers, or data races.

This is achieved with Rust's ownership system, which requires that all data have a single owner on the stack

Owners can lend out their data via "borrowing", which is checked at compile time by Rust's "Borrow Checker"

But I only ever write single-threaded programs, I'm never going to run into any of those bugs!

```
for(auto it=v.begin(); it!=v.end(); ++it) {  
    if (*it < 5) {  
        v.push_back(5 - *it);  
    }  
}
```

# Ownership & Borrowing

Rust has move semantics by default for most complex data types, which prevents having multiple variables having access to the same variable

When you assign a variable to another or pass it to function as an argument, it is no longer accessible

# Traits

Rust implements OO via a system called Traits

Similar to Type Classes in Haskell (and different from most OO), Traits do not have any associated data

# Weekly Rust News

Updates from Rust project, RFC updates.

## Updates from the Rust Project

390 pull requests were [merged in the last week](#)

### Compiler

- fix drop scope for `super let` bindings within `if let`
- stabilize c-style varargs for sysv64, win64, efiapi, aapcs

### Library

- add exact bitshifts
- constify impl Try for ControlFlow
- fix path str eq
- single buffer for exponent fmt of integers
- stabilize `path_add_extension`
- implement WASI<sup>2</sup>-specific stdio routines
- start supporting WASI<sup>2</sup> natively

### Cargo

- optimize Cargo with LTO
- `fix(manifest)` : Report script manifest errors for the right line number
- fix: switch from --nocapture to --no-capture
- render individual compilation sections in `--timings` pipeline graph

### Rustdoc

# Rust Book

<https://doc.rust-lang.org/book>

The screenshot shows the homepage of "The Rust Programming Language". The left sidebar contains a table of contents with sections like Foreword, Introduction, Chapter 1 (Getting Started), Chapter 2 (Programming a Guessing Game), Chapter 3 (Common Programming Concepts), Chapter 4 (Understanding Ownership), and Chapter 5 (Memory Safety). The main content area features the title "The Rust Programming Language" in large bold letters, followed by a subtitle "by Steve Klabnik, Carol Nichols, and Chris Krycho, with contributions from the Rust Community". It includes a note about Rust version assumptions, information about the HTML format, community translations, and availability in paperback and ebook format. A call-to-action at the bottom encourages users to try the interactive version of the book.

The Rust Programming Language

Foreword

Introduction

1. Getting Started

- 1.1. Installation
- 1.2. Hello, World!
- 1.3. Hello, Cargo!

2. Programming a Guessing Game

3. Common Programming Concepts

- 3.1. Variables and Mutability
- 3.2. Data Types
- 3.3. Functions
- 3.4. Comments
- 3.5. Control Flow

4. Understanding Ownership

- 4.1. What is Ownership?
- 4.2. References and Borrowing
- 4.3. The Slice Type

The Rust Programming Language

**The Rust Programming Language**

by Steve Klabnik, Carol Nichols, and Chris Krycho, with contributions from the Rust Community

This version of the text assumes you're using Rust 1.85.0 (released 2025-02-17) or later with `edition = "2024"` in the `Cargo.toml` file of all projects to configure them to use Rust 2024 edition idioms. See the "Installation" section of Chapter 1 to install or update Rust.

The HTML format is available online at <https://doc.rust-lang.org/stable/book/> and offline with installations of Rust made with `rustup`; run `rustup doc --book` to open.

Several community [translations](#) are also available.

This text is available in [paperback](#) and [ebook](#) format from No Starch Press.

 Want a more interactive learning experience? Try out a different version of the Rust Book, featuring quizzes, highlighting, visualizations, and more: <https://rust-book.cs.brown.edu>

# Cargo Book

<https://doc.rust-lang.org/cargo/>

Introduction

- 1. Getting Started
  - 1.1. Installation
  - 1.2. First Steps with Cargo
- 2. Cargo Guide
  - 2.1. Why Cargo Exists
  - 2.2. Creating a New Package
  - 2.3. Working on an Existing Package
  - 2.4. Dependencies
  - 2.5. Package Layout
  - 2.6. Cargo.toml vs Cargo.lock
  - 2.7. Tests
  - 2.8. Continuous Integration
  - 2.9. Publishing on crates.io
  - 2.10. Cargo Home
- 3. Cargo Reference
  - 3.1. The Manifest Format
    - 3.1.1. Cargo Targets

The Cargo Book

≡ ⌂ ⌂

# The Cargo Book

Cargo is the [Rust package manager](#). Cargo downloads your Rust package's dependencies, compiles your packages, makes distributable packages, and uploads them to [crates.io](#), the Rust community's [package registry](#). You can contribute to this book on [GitHub](#).

# Packages/Crates

# Package Filter

Located at <https://crates.io/>, formerly <https://crates.rs>

The screenshot shows the crates.io search interface. At the top, there's a dark header bar with the crates.io logo, a search input containing 'tokio', a magnifying glass icon, and links for 'Browse All Crates' and 'Log in with GitHub'. Below the header, a large title says 'Search Results for 'tokio''.

Below the title, it says 'Displaying 1-10 of 10107 total results' and 'Sort by Relevance'. The results are listed in a grid:

- tokio v1.47.1**  
An event-driven, non-blocking I/O platform for writing asynchronous I/O backed applications.

## tokio v1.47.1

An event-driven, non-blocking I/O platform for writing asynchronous I/O backed applications.

#async #futures #io #non-blocking

[Readme](#) [174 Versions](#) [Dependencies](#) [Dependents](#)

### Tokio

A runtime for writing reliable, asynchronous, and slim applications with the Rust programming language. It is:

- **Fast:** Tokio's zero-cost abstractions give you bare-metal performance.
- **Reliable:** Tokio leverages Rust's ownership, type system, and concurrency model to reduce bugs and ensure thread safety.
- **Scalable:** Tokio has a minimal footprint, and handles backpressure and cancellation naturally.

[crates.io v1.47.1](#) [license MIT](#) [CI passing](#) [chat 2.2k online](#)

[Website](#) | [Guides](#) | [API Docs](#) | [Chat](#)

#### Overview

### Metadata

 pkg:cargo/tokio@1.47.1 

 about 2 months ago

 v1.70.0

 MIT

 810 KiB

### Install

Run the following Cargo command in your project directory:

```
cargo add tokio
```

Or add the following line to your Cargo.toml:

```
tokio = "1.47.1"
```

#### Homepage

# Package Versions View

The screenshot shows the crates.io website interface for the package **tokio**. The top navigation bar includes the crates.io logo, a search bar with placeholder text "Type 'S' or '/' to search", a magnifying glass icon, and links for "Browse All Crates" and "Log in with GitHub".

The main content area displays the package name **tokio** in large bold letters, followed by a brief description: "An event-driven, non-blocking I/O platform for writing asynchronous I/O backed applications." Below the description are several hashtags: **#async #futures #io #non-blocking**.

A horizontal navigation bar below the description contains four items: "Readme", "174 Versions" (which is highlighted in green), "Dependencies", and "Dependents".

Below the navigation bar, a message indicates "100 of 174 **tokio** versions since July 1st, 2016". To the right, there is a "Sort by" dropdown menu set to "Date".

The main content area lists four recent versions of the **tokio** package:

- 1.x 1.47.1** BY ALICE RYHL ABOUT 2 MONTHS AGO  
@ v1.70.0 810 KIB MIT 13 FEATURES
- 1.x 1.43.2** BY ALICE RYHL ABOUT 2 MONTHS AGO  
@ v1.70.0 810 KIB MIT 13 FEATURES
- 1.x 1.47.0** BY ALICE RYHL ABOUT 2 MONTHS AGO  
@ v1.70.0 810 KIB MIT 13 FEATURES
- 1.x 1.46.1** BY ELIZA WEISMAN 3 MONTHS AGO  
@ v1.70.0 804 KIB MIT 13 FEATURES

# Cargo Tool

# Cargo Build Functionality

See options using `cargo COMMAND -h`

## **build**

Compile a package.

## **check**

Check a local package and all of its dependencies for errors.

## **doc**

Build a package's documentation.

## **run**

Build and run an executable.

## **install**

Install Cargo plugin/extension.

# Cargo Extensions

cargo-workspaces: manage multi-member workspaces

```
$ cargo install cargo-workspaces
```

cargo-expand: expand macros

```
$ cargo install cargo-expand
```

# Using cargo default functionality

```
$ cargo new my-project --bin
    Creating binary (application) `my-project` package
note: see more `Cargo.toml` keys and their definitions at https:/
```

## Creating package structure incl Cargo.toml

```
my-project/
├── Cargo.toml
└── src
    └── main.rs
```

## Cargo.toml

```
[package]
name = "my-project"
version = "0.1.0"
edition = "2024"
```

```
[dependencies]
```

# Programming Concepts

## Variables

# Variables and let-expression

File src/main.rs

```
fn main() {  
    let mut x = 5;  
    println!("The value of x is: {}", x);  
    x = 6;  
    println!("The value of x is: {}", x);  
}
```

# Variable Shadowing

```
fn main() {
    let x = 5;

    let x = x + 1;

    {
        let x = x * 2;
        println!("The value of x in the inner scope is: {x}");
    }

    println!("The value of x is: {x}");
}
```

# Variable Redefinition

```
let spaces = "    ";
let spaces = spaces.len();
```

# Programming Concepts

## Data Types

# Integer Types

| Length  | Signed | Unsigned |
|---------|--------|----------|
| 8-bit   | i8     | u8       |
| 16-bit  | i16    | u16      |
| 32-bit  | i32    | u32      |
| 64-bit  | i64    | 64       |
| 128-bit | i128   | u128     |

Note: Overflow is checked for + - \* / in release builds, instead use unchecked\_OP or wrapping\_OP

# Number Literals

| Number Literals | Example |
|-----------------|---------|
|-----------------|---------|

|         |        |
|---------|--------|
| Decimal | 98_222 |
|---------|--------|

|     |      |
|-----|------|
| Hex | 0xff |
|-----|------|

|       |      |
|-------|------|
| Octal | 0o77 |
|-------|------|

|        |             |
|--------|-------------|
| Binary | 0b1111_0000 |
|--------|-------------|

|       |      |
|-------|------|
| Bytes | b'A' |
|-------|------|

# Floating-Point Types

```
fn main() {  
    let x = 2.0; // f64  
  
    let y: f32 = 3.0; // f32  
}
```

# Numerical Operations

```
// addition
let sum = 5 + 10;

// subtraction
let difference = 95.5 - 4.3;

// multiplication
let product = 4 * 30;

// division
let quotient = 56.7 / 32.2;
let truncated = -5 / 3; // Results in -1

// remainder
let remainder = 43 % 5;
```

# Boolean Type

```
fn main() {  
    let t = true;  
  
    let f: bool = false; // with explicit type annotation  
}
```

# Character Type (Utf8)

```
fn main() {  
    let c = 'z';  
    let z: char = ' ZX'; // with explicit type annotation  
    let heart_eyed_cat = '😻';  
}
```

# Tuple Types

```
let tup: (i32, f64, u8) = (500, 6.4, 1);

// same using inference
let tup = (500, 6.4, 1);

let (x, y, z) = tup;

println!("The value of y is: {y}");
```

# Tuple Types

## Special Nothing Type

```
let none_type = ();
// cannot be printed
```

# Array Types

```
let a: [i32; 5] = [1, 2, 3, 4, 5];

let months = ["January", "February", "March", "April", "May",
              "August", "September", "October", "November", ""]

let a = [3; 5];

// accessing
let first = a[0];
let second = a[1];
```

# String Types

## Basic str& Reference vs String Object.

```
fn main() {  
    let basic_string : &'static str =  
        "Static String, length encoded";  
    let dynamic_string_object: String =  
        format!("{} {}", "Dynamic", "String");  
    let basic_string_with_lifetime : &str =  
        &dynamic_string_object;  
  
    println!("{:?})", basic_string_with_lifetime);  
}
```

Basic String are simple Char arrays, UTF8 encoded

# Raw Strings Types

Raw String are u8 bytes arrays.

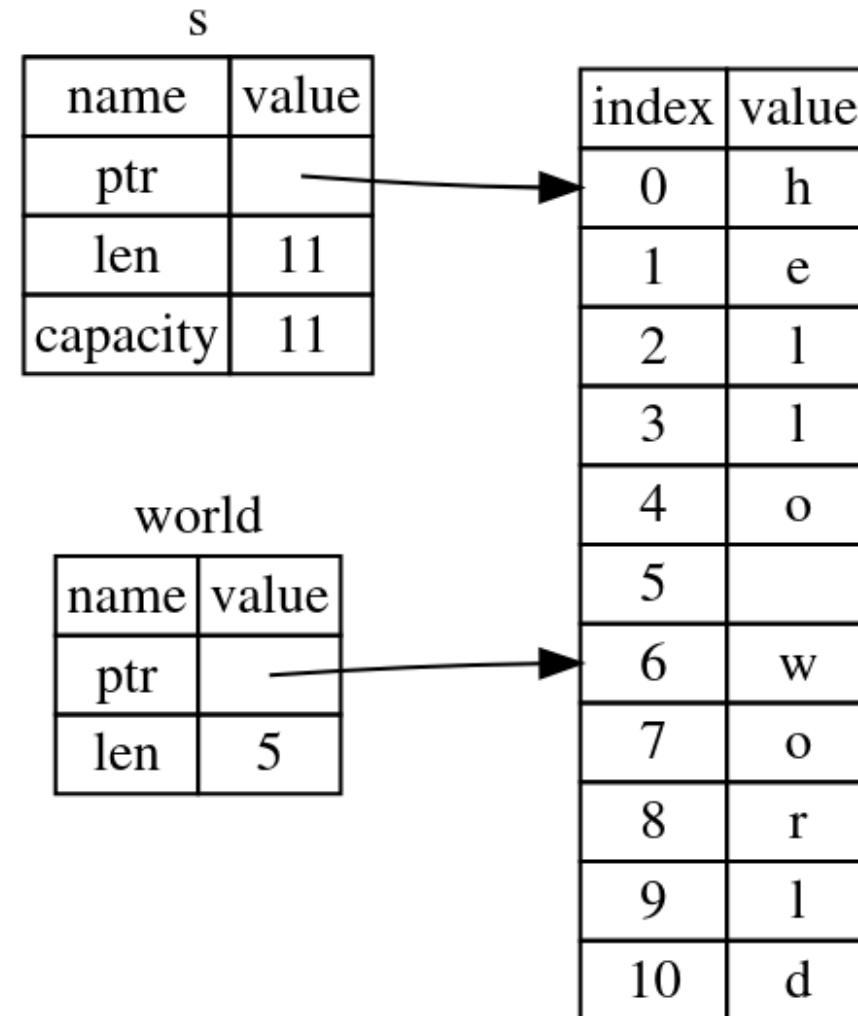

```
fn main() {  
    let raw_byte_string: &[u8; 48] =  
        b"HTTP/2 200\ncontent-type: text/css; charset=utf-8";  
    let raw_byte_string_slice = &raw_byte_string[0..5];  
  
    println!("{}:{}:", raw_byte_string_slice);  
}
```

# String Slices

Slices are length encoded.

```
fn main() {
    let s = String::from("hello world");

    let hello: &str = &s[0..5];
    let world: &str = &s[6..11];
}
```

# Types Example

```
use std::io;
fn main() {
    println!("Please enter an array index.");
    let mut index = String::new();
    io::stdin()
        .read_line(&mut index)
        .expect("Failed to read line");
    let index: usize = index
        .trim()
        .parse()
        .expect("Index entered was not a number");
    println!("The value is {}", index);
}
```

# Programming Concepts

## Functions

# Functions & Parameters

```
fn main() {
    another_function(5);
}

fn another_function(x: i32) {
    println!("The value of x is: {}", x);
}
```

# Functions & Parameters

```
fn main() {
    another_function(5);
}

fn another_function(x: i32) {
    println!("The value of x is: {}", x);
}
```

# Expressions

```
fn main() {  
    let y = {  
        let x = 3;  
        x + 1  
    };  
  
    println!("The value of y is: {}", y);  
}
```

# Return Values

## Expressions vs return statement

```
// expression
fn five() -> i32 {
    5
}

// using return statement
fn six() -> i32 {
    return 5;
}

fn main() {
    let x = five();

    println!("The value of x is: {}", x);
}
```

# Lambda expressions

```
// global constant, static-lifetime
const BASE: i32 = 100;

fn main() {
    let offset = | d: i32 | -> i32 { BASE + d };

    println!("The offset value is: {}", offset(5));
}
```

# Programming Concepts

## Macros

Meta-Programming,  
transforming parser's token  
stream.

- Custom derive-Macros.
- Attribute-like macros.
- Function-like macros (eg `vec!`).

# Function like macros

Create vector with builtin macro `vec!`!

```
let v: Vec<u32> = vec![1, 2, 3];
```

```
let v: Vec<u32> = <[_]>::into_vec(  
    ::alloc::boxed::box_new([1, 2, 3]));
```

```
# [macro_export]  
macro_rules! vec {  
    () => { ... };  
    ($elem:expr; $n:expr) => { ... };  
    ($($x:expr),+ $(),?) => { ... };  
}
```

# Custom derive-Macros

## Transformation by macro expansion

```
# [derive(Debug)]
struct DataT {
    flag: bool,
    val: isize,
}
```

```
// These macros
// are a bit
// more complex,
// as compiler plugin.
```

```
# [automatically_derived]
impl ::core::fmt::Debug for DataT {
    #[inline]
    fn fmt(&self, f: &mut ::core::fmt::Formatter)
        -> ::core::fmt::Result {
            ::core::fmt::Formatter::debug_struct_field2_fi
                f,
                "DataT",
                "flag",
                &self.flag,
                "val",
                &&self.val,
            )
        }
}
```

# Programming Concepts

Comments  
and API Docs

# Comments & API Docs

```
//! First line as title of front page.  
//!  
//! Futher lines describing  
//! the application.  
  
/// This module makes it easy.  
pub mod easy {  
  
    /// Use the abstraction function to do this specific thing.  
    pub fn abstraction() {  
        // simple comment  
        let x = 7;  
        ...  
    }  
}
```

# API Doc Generation

```
1 cargo doc
2 Documenting libc v0.2.175
3 // snip
4 Documenting mylib1 v0.0.0 (./project/mylib1)
5     Finished `dev` profile [unoptimized + debuginfo] target(s)
6     Generated ./project/target/doc/mylib1/index.html
```

# Programming Concepts

## Control Flow

# If Expression

```
fn main() {  
    let number = 6;  
  
    if number % 4 == 0 {  
        println!("number is divisible by 4");  
    } else if number % 3 == 0 {  
        println!("number is divisible by 3");  
    } else if number % 2 == 0 {  
        println!("number is divisible by 2");  
    } else {  
        println!("number is not divisible by 4, 3, or 2");  
    }  
}
```

# if in let Expressions

```
fn main() {  
    let condition = true;  
    let number = if condition { 5 } else { 6 };  
  
    println!("The value of number is: {number}");  
}
```

# let in if Expressions

```
type enum Data { Foo(i32), Bar(u32) };
```

```
fn do_something(data: &Data) {
    if let Data::Foo(val) = data {
        do_foo(val);
    }
}
```

# loop Expressions

```
fn main() {
    let mut counter = 0;

    let result = loop {
        counter += 1;

        if counter == 10 {
            break counter * 2;
        }
    };

    println!("The result is {result}");
}
```

# Conditional Loops with while

```
fn main() {
    let mut number = 3;

    while number != 0 {
        println!("{}!", number);

        number -= 1;
    }

    println!("LIFTOFF!!!");
}
```

# Looping Through a Collection with for

```
fn main() {
    for number in (1..4).rev() {
        println!("{}!", number);
    }
    println!("LIFTOFF!!!");
}
```

# Ownership

## How a Rust program manages memory

- Each value in Rust has an owner.
- There can only be one owner at a time.
- When the owner goes out of scope, the value will be dropped.
- By default values are immutable.

# Variable Scope

Base string in static memory.

```
{                                // s is not valid here, not yet declared
    let s = "hello"; // s is valid from this point forward

    // do stuff with s
}                                // this scope is now over, no longer valid
```

Note: s is static str-ref

```
{  
    let s: &'static str = "...";  
}
```

# Complex Object (String)

## Immutable String

```
let s = String::from("hello");
```

# Complex Object (String)

Mutable String, allocated on heap.

```
let mut s = String::from("hello");

s.push_str(", world!"); // push_str() appends a literal to a

println!("{}"); // this will print `hello, world!`
```

# Variables and Data - Copy

Integers have known size and are copied.

```
let x = 5; // integer has known size
let y = x;
// x and y accessible
```

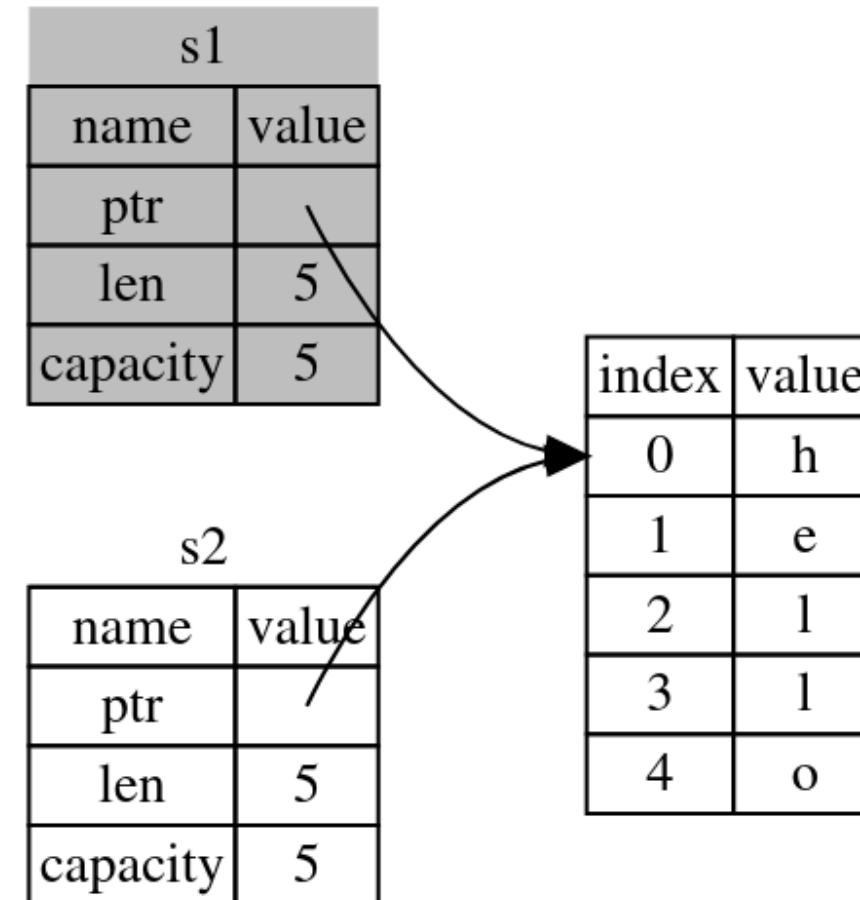

# Variables and Data - Move

Size unknown.

No Copy implemented.

Ownership moved.

```
let s1: String = String::from("hello");
let s2 = s1;
// s1 no longer accessible,
// ownership moved to s2
```

# Variables and Data - Clone

Perform deep copy.

```
let s1 = String::from("hello");
let s2 = s1.clone();

println!("s1 = {s1}, s2 = {s2}");
```

s1

| name     | value |
|----------|-------|
| ptr      | —     |
| len      | 5     |
| capacity | 5     |

| index | value |
|-------|-------|
| 0     | h     |
| 1     | e     |
| 2     | l     |
| 3     | l     |
| 4     | o     |

s2

| name     | value |
|----------|-------|
| ptr      | —     |
| len      | 5     |
| capacity | 5     |

| index | value |
|-------|-------|
| 0     | h     |
| 1     | e     |
| 2     | l     |
| 3     | l     |
| 4     | o     |

# Return Values and Scope

```
fn create() -> String { String::from("hello") }

fn take_and_return(s: String) -> String { s }

fn main() {
    let s1 =
        create();      // return value moved,
                      // assigned to s1
    let s2 =
        takes_and_returns(s1); // s1 is moved into
                              // fn returns some String
                              // assigned to s2
}
```

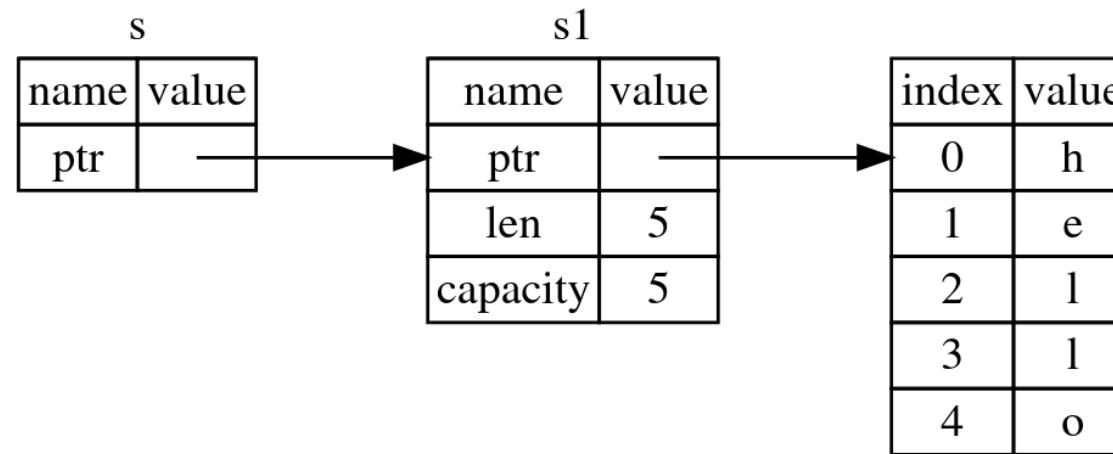

# References & Borrowing

## How a Rust program manages memory

- Reference is guaranteed to point to a valid value.
- Mutable values can be referenced once only.
- References are bound to lifetime of value.
- Global values must be const or protected (lock).

# References & Borrowing - Immutable

```
1 fn main() {
2     let s1 = String::from("hello");
3
4     let len = calculate_length(&s1);
5
6     println!("length of '{s1}' is {len}.");
7 }
8
9 fn calculate_length(s: &String) -> usize {
10     s.len()
11 }
```

# References & Borrowing - Immutable Immutable Static

```
1 const UUID: &'static str = "919950d0-9..";
2 fn main() {
3     let uuids: Vec<&'static str> = vec![UUID];
4     ...
5 }
```

# References & Borrowing - Mutable

```
1 fn main() {
2     let s = String::from("hello");
3
4     change(&mut s);
5 }
6
7 fn change(some_string: &mut String) {
8     some_string.push_str(", world");
9 }
```

# Global Values

## **static**

A possibly mutable variable with 'static' lifetime

## **const**

An unchangeable value (the common case).

## Lazy Static Variable

```
1 use std::sync::LazyLock;
2
3 static LAZY: LazyLock<i32>
4 = LazyLock::new(|| {
5     println!("initializing");
6     92
7 });
8 fn main() {
9     println!("ready");
10    println!("{}" , &*lazy);
11 }
```

## Const Variable

```
1 const CONST_VAL: i32 = 92;
2 fn main() {
3     println!("{}" , CONST_VAL);
4 }
```

# Structures

## Grouping Data

- Visibility of fields defaults to private.
- Outside of module, only 'pub' fields may be accessed.
- Function implementations may read/modify fields.

# Defining and Instantiating Structs

```
1 struct User {  
2     active: bool,  
3     username: String,  
4     email: String,  
5     sign_in_count: u64,  
6 }  
7  
8 fn main() {  
9     let user1 = User {  
10         active: true,  
11         username: String::from("someusername123"),  
12         email: String::from("someone@example.com"),  
13         sign_in_count: 1,  
14     };  
15 }
```

# Function Returning Struct

```
1 struct User {  
2     active: bool,  
3     username: String,  
4     email: String,  
5     sign_in_count: u64,  
6 }  
7  
8 fn build_user(email: String, username: String) -> User {  
9     User {  
10         active: true,  
11         username: username,  
12         email: email,  
13         sign_in_count: 1,  
14     }  
15 }
```

# Using the Field Init Shorthand

```
1 struct User {  
2     active: bool,  
3     username: String,  
4     email: String,  
5     sign_in_count: u64,  
6 }  
7  
8 fn build_user(email: String, username: String) -> User {  
9     User {  
10         active: true,  
11         username,  
12         email,  
13         sign_in_count: 1,  
14     }  
15 }
```

# Using the Update Syntax

```
1 struct User {  
2     active: bool,  
3     username: String,  
4     email: String,  
5     sign_in_count: u64,  
6 }  
7 fn main() {  
8     let user1 = User { .. };  
9     // --snip--  
10  
11    let user2 = User {  
12        email: String::from("another@example.com"),  
13        ..user1  
14    };  
15 }
```

# Using Tuple Structs Without Named Fields

```
1 struct Color(i32, i32, i32);
2 struct Point(i32, i32, i32);
3
4 fn main() {
5     let black = Color(0, 0, 0);
6     let origin = Point(0, 0, 0);
7 }
```

# Unit-Like Structs

Without Named Fields, used for stateless objects.

```
1 struct AlwaysEqual;  
2  
3 fn main() {  
4     let subject = AlwaysEqual;  
5 }
```

# Tuple Struct - Example

```
1 fn main() {
2     let rect1 = (30, 50);
3
4     println!(
5         "The area of the rectangle is {} square pixels.",
6         area(rect1)
7     );
8 }
9
10 fn area(dimensions: (u32, u32)) -> u32 {
11     dimensions.0 * dimensions.1
12 }
```

# Defining Methods with `impl`

The `&self` is a short for 'self: &Self'.

```
1 #[derive(Debug)]
2 struct Rectangle {
3     width: u32,
4     height: u32,
5 }
6 impl Rectangle {
7     fn area(&self) -> u32 { self.width * self.height }
8 }
9 fn main() {
10     let rect1 = Rectangle { width: 30, height: 50, };
11     println!("The area of the rectangle is {} square pixels.", 
12             rect1.area())
13 }
14 }
```

# Defining Methods with `impl`

## More parameters.

```
1 #[derive(Debug)]  
2 struct Rectangle {  
3     width: u32,  
4     height: u32,  
5 }  
6 impl Rectangle {  
7     fn area(&self) -> u32 {  
8         self.width * self.height  
9     }  
10    fn can_hold(&self, other: &Rectangle) -> bool {  
11        self.width > other.width && self.height > other.height  
12    }  
13 }
```

# Defining Methods with `impl`

## Associated Functions - May be used as Constructors

```
1 #[derive(Debug)]
2 struct Rectangle {
3     width: u32,
4     height: u32,
5 }
6 impl Rectangle {
7     fn square(size: u32) -> Self {
8         Self {
9             width: size,
10            height: size,
11        }
12    }
13 }
```

# Defining Methods with `impl`

Multiple `impl` blocks allowed.

```
1 impl Rectangle {
2     fn area(&self) -> u32 {
3         self.width * self.height
4     }
5 }
6
7 impl Rectangle {
8     fn can_hold(&self, other: &Rectangle) -> bool {
9         self.width > other.width && self.height > other.height
10    }
11 }
12 }
```

Enums and  
Pattern  
Matching

# Defining an Enum

Enumerate all possible variants.

```
1 enum IpAddr {  
2     V4,  
3     V6  
4 }  
5
```

# Defining an Enum - Tuple-Type

Enumerate all possible variants.

```
1 enum IpAddr {  
2     V4(u8, u8, u8, u8),  
3     V6(String),  
4 }  
5  
6 let home = IpAddr::V4(127, 0, 0, 1);  
7  
8 let loopback = IpAddr::V6(String::from("::1"));
```

# Defining an Enum - Struct-Type

Enumerate all possible variants.

```
1 enum IpAddr {  
2     V4{ addr: [u8; 4], },  
3     V6{ addr: String, },  
4 }  
5  
6 let home = IpAddr::V4{addr: [127, 0, 0, 1]};  
7  
8 let loopback = IpAddr::V6{addr: String::from("::1")}, };
```

# Option Type

## Avoid "Null References: The Billion Dollar Mistake"

```
1 // declared in std::option
2 enum Option<T> {
3     None,
4     Some(T),
5 }
```

```
1 use std::option::Option;
2 fn main() {
3     let some_number = Some(5);
4     let some_char = Some('e');
5
6     let absent_number: Option<i32> = None;
7 }
```

Note: The <T> is a generic type parameter.

# Result Type

```
1 // declared in std::result
2 enum Result<T, E> {
3     Ok(T),
4     Err(E),
5 }
```

```
1 use std::fs::File;
2 use std::io::Error;
3 use std::result::Result;
4 fn main() {
5     let result: Result<std::fs::File, std::io::Error> =
6         File::open("hello.txt");
7     match result {
8         Ok(fout) => { /* write to open file */ },
9         Err(error) => {
10             println!("Failed to open file {}", error);
11         }
12     }
13 // snip
14 }
```

Note: The <T> is a generic type parameter.

# The match Control Flow Construct

```
1 enum Coin {  
2     Penny,  
3     Nickel,  
4     Dime,  
5     Quarter,  
6 }  
7 fn value_in_cents(coin: Coin) -> u8 {  
8     match coin {  
9         Coin::Penny => { println!("Lucky penny!"); 1 },  
10        Coin::Nickel => 5,  
11        Coin::Dime => 10,  
12        Coin::Quarter => 25,  
13    }  
14 }
```

# Pattern Bindings

```
1
2 enum Coin { Penny, Nickel, Dime, Quarter(String), }
3
4 fn value_in_cents(coin: Coin) -> u8 {
5     match coin {
6         Coin::Penny => 1,
7         Coin::Nickel => 5,
8         Coin::Dime => 10,
9         Coin::Quarter(state) => {
10             println!("State quarter from {}", state);
11             25
12         }
13     }
14 }
```

# Implement Functions for Enum

```
1 enum Coin { Penny, Nickel, Dime, Quarter(String), }
2
3 impl Coin {
4     fn value_in_cents(&self) -> u8 {
5         match self {
6             Coin::Penny => 1,
7             Coin::Nickel => 5,
8             Coin::Dime => 10,
9             Coin::Quarter(_state) => 25,
10        }
11    }
12 }
```

Note: variable `_state` marked as unused

# Matching with Option

```
1 fn plus_one(x: Option<i32>) -> Option<i32> {
2     match x {
3         _ => None,
4         Some(i) => Some(i + 1),
5     }
6 }
7 // snip ..
8 let five = Some(5);
9 let six = plus_one(five);
10 let none = plus_one(None);
```

# Concise Control Flow with if let and let else

```
1 let config_max = Some(3u8);
2 match config_max {
3     Some(max) => println!("The maximum is configured to be {max}
4     _ => (),
5 }
```

shorter, but loosing exhaustive check of all variants

```
1 let config_max = Some(3u8);
2 if let Some(max) = config_max {
3     println!("The maximum is configured to be {max}");
4 }
```

# Type Aliases

Keyword `type` defines a type alias.

```
1 type CoinBag = Vec<coin>;  
2 </coin>
```

# Hands On 1

- Create workspace with Cargo.
- Implement this function returning a None in case  $x==7$  otherwise ident.

```
1 fn do_call(x: i32) -> Option<i32> ;
```

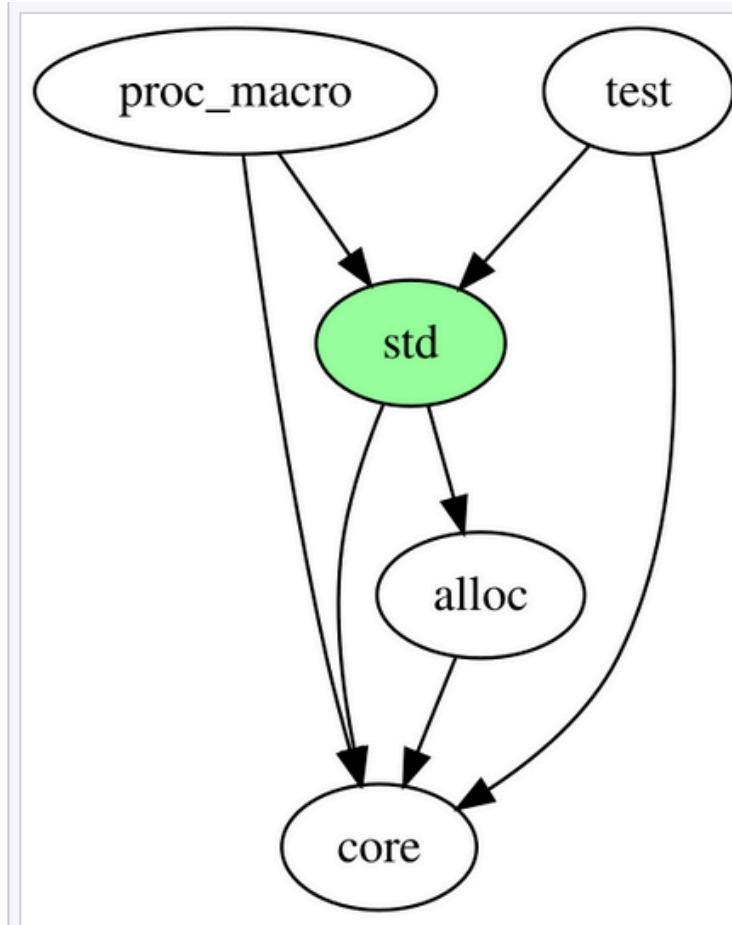

- Call the function from main and print value, or an error message in case of None.

# Packages and Crates

- Crate is the smallest unit, binary or library.
- Binary crates start execution in main function.
- Library crates don't have a main function.
- Library crates share functionality with multiple projects.
- A package bundles multiple crates and contains a Cargo.toml
- A package contains at most one library.

# Packages

std vs nostd

std  
VS  
nostd

| Target        | nostd<br>Packages                 | std<br>Packages                           |

# Creating a package

```
1 $ cargo new my-project --bin
2     Creating binary (application) `my-project` package
3 note: see more `Cargo.toml` keys and their definitions at https://
```

## Creating the file structure

```
1 my-project/
2   └── Cargo.toml
3   └── src
4     └── main.rs
```

# Organization - Crate root

**Start from the crate root** `src/main.rs` or `src/lib.rs`.

```
1 my-project/
2   └── Cargo.toml
3   └── src
4     └── main.rs
```

# Organization - Modules

## Declaring modules inline.

```
1
2 mod mytool {
3     // Code within a module is private by default
4     pub fn myfunc()    { /* snip */ }
5 }
6 use mytool::myfunc; // create shortcut
7
8 fn main() {
9     println!("Hello, world!");
10    myfunc();
11 }
```

# Organization - Modules

## Declaring modules as file.

```
1
2 mod mytool;
3 use mytool::myfunc; // create shortcut
4
5 fn main() {
6     println!("Hello, world!");
7     myfunc();
8 }
```

my-project/src/mytool.rs

```
1 // Code within a module is private by def
2 pub fn myfunc() { /* snip */ }
```

```
1 my-project/
2   └── Cargo.toml
3   └── src
4     ├── main.rs
5     └── mytool.rs
```

# Organization - Modules

## Declaring modules as directory.

```
1 mod mytool;
2 use mytool::myfunc; // create shortcut
3 fn main() {
4     println!("Hello, world!");
5     myfunc();
6 }
7 }
```

```
1 my-project/
2   └── Cargo.toml
3   └── src
4     └── main.rs
5     └── mytool
6       └── mod.rs
```

my-project/src/mytool/mod.rs

```
1 // Code within a module is private by def
2 pub fn myfunc() { /* snip */ }
```

# Organization - Submodules

## Inline

```
1 mod mytool {  
2     // snip  
3     mod network { /* snip */ }  
4 }  
5 fn main() {  
6     println!("Hello, world!");  
7     mytool::myfunc();  
8 }  
9 }
```

## File-based

```
1 my-project/  
2   └── Cargo.toml  
3   └── src  
4       └── main.rs  
5       └── mytool  
6           └── mod.rs  
7           └── network.rs
```

## Directory-based

```
1 my-project/  
2   └── Cargo.toml  
3   └── src  
4       └── main.rs  
5       └── mytool  
6           └── mod.rs  
7           └── network  
8               └── mod.rs
```

# Organization - Item Paths

- Absolute paths from crate root, eg

```
1 use crate::mytool::*;

```

- Relative paths starting from current module, using 'self::', 'super::', or local identifier, eg

```
1 use self::mytool::*;
2 pub use super::mytool::myfunc; // re-export with 'pub use'
3 use std::collection::HashMap as StdHashMap; // re-name
4 use std::io;
5 use rand::Rng; // shortcut to Item in external package
6 // snip
```

# Organization - Nested Paths

## List consuming vertical space

```
1 // --snip--  
2 use std::cmp::Ordering;  
3 use std::io;  
4 // --snip--
```

Instead use nested paths

```
1 // --snip--  
2 use std::{cmp::Ordering, io};  
3 // --snip--
```

# Organization - Nested Paths

List consuming vertical space

```
1 // --snip--  
2 use std::io;  
3 use std::io::Write;  
4 // --snip--
```

Instead use nested path with self.

```
1 // --snip--  
2 use std::io::{self, Write};  
3 // --snip--
```

    // Tell Cargo that if the given file changes, to rerun this build script.
    println!("cargo::rerun-if-changed=src/adapter.c");
    // Use the `cc` crate to build a C file and statically link it into the
    // binary.
    cc::Build::new()
        .file("src/adapter.c")
        .compile("adapter");
```

# Hands On 2

- Create workspace with Cargo.
- Use the std::fs::File::open function to open a file and read content into String.
- Call the function from main and size of buffer.  
Challenge: File-IO, Result-Enum, Std-IO-Error handling.

# Hands On 3

- Define a String and convert into u8 byte-array
- Iterate the byte-array with map/filter and count the spaces.

# Hands On 4

- Define a String (assume String is very large)
- Iterate the array with map/filter and 'take' first 10 capital letters.
- return the sequence of 10 capital letters

# Collections

- Vector storing N values in contiguous memory.
- String is a collection of characters.
- HashMap associates specific keys each with a value.

# Vector - Create

```
1 // creating empty vector
2 let v: Vec<i32> = Vec::new();
3
4 // usage of vec macro
5 let v = vec![1, 2, 3];
6
7 // create vector with 7 elements
8 let v = vec![42; 7];
```

# Vector - Modify

Vector v must be mutable.

```
1 let mut v = Vec::new();  
2  
3 v.push(5);  
4 v.push(6);  
5 v.push(7);  
6 v.push(8);
```

# Vector - Read

```
1 let v = vec![1, 2, 3, 4, 5];
2 let third: &i32 = &v[2]; // may panic if index out of bound
3 println!("The third element is {third}");
4
5 let third: Option<&i32> = v.get(2); // may return Option::None
6 // if index out of bound
7 match third {
8     Some(third) => println!("The third element is {third}"),
9     None => println!("There is no third element."),
10 }
```

# Vector - Iterator Chaining

Iterators combined with functions like map, filter, and sum.

```
1 let result: i64 = (1..=100)
2     .filter(|x: &i32| -> bool { x % 3 == 0 })
3     .map(|x| -> i64 {x as i64})
4     .sum();
```

# String Container

```
1 let s1 = String::from("Hello, ");
2 let s2 = String::from("world!");
3 let s3 = s1 + &s2; // note s1 has been moved here
4                         // and can no longer be used
5 let first_letter: Option<char> = s3.chars().nth(0);
6 let s3_slice = &s3[0..5];
```

# Associated Key-Value Pairs - HashMap

```
1 let mut scores = HashMap::new();
2
3 scores.insert(String::from("Blue"), 10);
4 scores.insert(String::from("Yellow"), 50);
5
6 let upper_scores :Vec<String>= scores.iter()
7     .filter(|(key,value)| **value > 20)
8     .map(|(key, _)| key)
9     .collect();
```

# String Container

```
1 let s1 = String::from("Hello, ");
2 let s2 = String::from("world!");
3 let s3 = s1 + &s2; // note s1 has been moved here
4                         // and can no longer be used
5 let first_letter: Option<char> = s3.chars().nth(0);
6 let s3_slice = &s3[0..5];
```

# Error Handling

- Recoverable Errors.
- Unrecoverable Errors.

# Unrecoverable Error

For example caused by

- Accessing an array past the end.
- Integer overflow.

Strategies to end the execution

- unwind - heavy process releasing resources.
- abort - immediate termination, OS releasing resources.

Cargo.toml parameter

```
1 [profile.release]
2 panic = 'abort'
```

# Recoverable Errors

For example caused by bad file IO

```
1 use std::fs::File;
2 use std::io::Error;
3 use std::result::Result;
4
5 fn main() {
6     let result: Result<std::fs::File, std::io::Error> =
7         File::open("hello.txt");
8     match result {
9         Ok(fout) => { /* write to open file */ },
10        Err(error) => {
11            println!("Failed to open file {}", error);
12        }
13    }
14 // snip
15 }
```

# Generics

- Generic Data Types.
- Traits: Defining shared behavior.

# Generic Lists

```
1 fn largest(list: &[i32]) -> &i32 {
2     let mut largest = &list[0];
3     for item in list { if item > largest { largest = item; } }
4     largest
5 }
6
7 fn main() {
8     let number_list = vec![34, 50, 25, 100, 65];
9
10    let result = largest(&number_list);
11    println!("The largest number is {result}");
12 }
```

# Generic Parameters

Op '>' requires T implements PartialOrd trait

```
1 fn largest<T>(list: &[T]) -> &T
2     where T: PartialOrd {
3         let mut largest = &list[0];
4         for item in list { if item > largest { largest = item; } }
5         largest
6     }
7
8 fn main() {
9     let number_list = vec![34, 50, 25, 100, 65];
10
11    let result = largest(&number_list);
12    println!("The largest number is {result}");
13 }
```

# PartialOrd Trait

```
1
2 pub trait PartialOrd<Rhs = Self>: PartialEq<Rhs>
3 where
4     Rhs: ?Sized,
5 {
6     // Required method
7     fn partial_cmp(&self, other: &Rhs) -> Option<Ordering>
8
9     // Provided methods
10    fn lt(&self, other: &Rhs) -> bool { ... }
11    fn le(&self, other: &Rhs) -> bool { ... }
12    fn gt(&self, other: &Rhs) -> bool { ... }
13    fn ge(&self, other: &Rhs) -> bool { ... }
14 }
```

# Impl Trait For Custom Type

Op '>' requires T implements PartialOrd trait

```
1 struct Num (isize);
2 impl PartialOrd for Num {
3     fn partial_cmp(&self, other: &Self) -> Option<Ordering> {
4         self.0.partial_cmp(&other.0)
5     }
6 }
7 impl PartialEq for Num {
8     fn eq(&self, other: &Self) -> bool {
9         self.0 == other.0
10    }
11 }
12 fn main() {
13     let number_list = vec![Num(34), Num(50), Num(25), Num(100)
14     let result = largest(&number_list);
15     // snip
16 }
```

# Exercise: Read File

```
1
2 use std::io::{Error, Read};
3 use std::path::Path;
4
5 fn read_file(name: &str) -> Option<String> {
6     let path : &Path = Path::new(name);
7     match File::open(path) {
8         Ok(mut f) => {
9             let mut buffer = String::new();
10            // read the whole file
11            f.read_to_string(&mut buffer);
12            Some(buffer)
13        }
14        Err(e) => {
15            println!("Failed to read file {e}");
16        }
17    }
18}
```

**THE END**
